WATERING GUIDELINES

GENERAL WATER GUIDELINES

Water twice per week for the first two weeks after planting. Then once per week, dependent on rainfall, for the first summer they have been planted. Putting mulch around the base of plants and trees helps hold in the moisture longer than bare soil.

After the first year, they should be established enough that normal rainfall will take care of watering needs. In dry years, water once per week.

PLANT SPECIFIC WATER GUIDELINES

Large Deciduous Trees

- Water 3-5 minutes at full stream
- You've watered enough when water emerges to surface of the ground and no longer soaks in

Deciduous Shrubs

- Water two times per week for about one minute on full stream

Junipers

- One thorough watering each week for about one minute

Perennials

- Water for 30 seconds, 2 - 3 times per week
- Some perennials will need more water than others
- Watch for wilting and always water from the base

Yews

- Water once a week for 30 seconds

Ground Covers

- Water 30 seconds every other day

SUGGESTIONS

- Purchase a watering wand
- Water at the base of plant instead of from the top
- Do not overwater evergreen trees
- Keep in mind the location of plants
